Integrating Articulate Storyline content with Canvas

Method	How to	Pros	Cons
SCORM	• Export as LMS SCORM zip package. • Upload as an assignment in Canvas using SCORM.	• Best integration with Canvas (provided content is structured and output in a way compatible with gradebook).	• Can't use screen readers. • Not straightforward to set up completion monitoring as several steps involved apart from correct export settings. • Only students enrolled in Canvas course can see content.
Web content option (zip file import)	• Export as LMS SCORM zip package • Import through Files in Canvas – expand zip file when importing • Provide link to html file (index file) from an image or text. • Work around to open in new window is to open in Firefox. • Right click inside frame and choose open in new window – • Copy the resulting link and re-link using that.	• Students don't need to be enrolled to see content.	• Can't use screen readers. • Can't track completion. • Doesn't work well for long courses. • Student progress not retained between sessions (therefore unsuitable for certain styles of content). • Doesn't integrate assessments with Canvas gradebook.
Link to online content	• Host on server • Provide a link to existing web content.	• Can create public course where anyone can have access. • Single point of dispatch (so future updates only have to happen to one instance-futureproofing).	• Content is external to Canvas (Can be remedied by having quiz in Canvas). • Need dedicated server.
Create in Canvas	• Create directly in Canvas course.	• Quizzes and content integrated.	• Some design elements from Articulate may not be present, or relatively expert knowledge of html coding is required.
